Animal Rabies Cases in Central Texas, Annual Report, 2015

Health Service Region 7 (HSR7) Zoonosis Control investigated **527 positive and non-negative animal rabies laboratory reports** during the entirety of 2015. Past years' animal rabies numbers may be found at: <http://www.dshs.state.tx.us/idcu/disease/rabies/cases/statistics/>.

HSR7 staff and local animal control officers collectively investigated **393 laboratory-confirmed positive rabies cases** within the 30-county area of HSR7. **Eighty-three (83) persons and 431 animals were exposed or potentially exposed to these rabid animals.**

HSR7 staff and local animal control officers collectively investigated an additional **134 non-positive, non-negative (“decomposed” and “destroyed”) rabies cases. Sixteen (16) people and 36 animals were exposed or potentially exposed to these rabies suspect animals.**

Most persons determined to be exposed or potentially exposed to rabies from these cases received postexposure rabies vaccinations from local health care providers. Animals exposed to rabid animals were processed by Local Rabies Control Authorities in accordance with the Rabies Control and Eradication Rules, Section 169.30, and either: (1) vaccinated and confined at home for either 45 or 90 days, according to the animals' vaccination status at the time of exposure, or (2) humanely euthanized.

Of the **393 positive** cases, rabies was detected in **136 skunks, 227 bats, 3 dogs, 11 raccoons, 9 foxes, 5 cats, 1 cow and 1 pig.**

Travis and Williamson Counties lead all Central Texas counties with the most rabies cases simply as a result of bat numbers. Bats lead skunks as the most common rabid animal confirmed through laboratory testing in Region 7 counties which is typical for the

region. Bell, Brazos, Llano, McLennan, and Washington Counties lead the region with positive skunk numbers all with greater than 10 samples this year.

All of the rabid domestic and companion animal cases have been acquired through contact with rabid skunks.

The 393 positive rabies cases in Health Service Region 7 represent the most rabies cases investigated in 2015 by any DSHS Regional Zoonosis Control Program.

HSR7 Zoonosis Control personnel could not have met the time-sensitive investigation requirements of these cases without the help of animal control officers, veterinarians, peace officers, health care providers and others. Their prompt responses no doubt saved human and animal lives during the past year.

The 2015 rabies cases are recorded in the “Positive Animal Rabies Cases, Three-Year Comparison, 2013, 2014, 2015” table and are depicted on the map “Health Service Region 7, Positive Animal Rabies Cases, January 1 – December 31, 2015”. Please note the map displays cases based on longitude and latitude coordinates. Because some counties’ cases occurred in close proximity to each other, some individual map symbols may not be distinguishable.

[Note: The rabies data presented in this document were obtained through a passive reporting system and may be subject to change. The data was based solely on the results of animals submitted for rabies testing. There were many more animals (particularly wildlife) that died of rabies that were not submitted for rabies testing.]

Rabies is endemic in Central Texas, and ALL Health Service Region 7 counties have rabies risk.

E-MAIL ALERTS

If you know of others in your agency or community who want to know about animal rabies events in Central Texas, encourage them to share their contact information and e-mail address with us at 254/ 778-6744, ext. 6784 or HSR7.ZOO@dshs.state.tx.us.

HSR7 Zoonosis Control Program personnel (Temple, TX): Stay in Touch
